

truebner

TRUEBNER was founded in 2012 as a manufacturer of moisture sensors for scientific applications. Extensive large-scale hydrological experiments require highly accurate, durable and at the same time inexpensive sensors, which did not exist at that time.

Based on 25 years of combined experience in moisture measurement technology and industrial electronics manufacturing, the two founders developed the SMT100.

A decade later, the SMT100 is one of the most widely used soil moisture sensors.

The product range was expanded over time with the SMT50 for Smart Garden applications and the upcoming SMT500 profile sensor for agriculture. In addition to the TRUEBNER brand, our company is also an OEM supplier and development service provider in the entire field of material moisture measurement technology.
